

Custom Chat Colors [1.5]

Hello everyone, since the original thread about this subject was removed by Gunblade. (<http://forum.ragezone.com/f245/custo...olours-883015/>) I decided to remake it, for someone who has recently asked for it, in the help section.

So, here you go if anyone else want it...

Go to **Stable/Mint2/Source/MDrawContext.cpp**

and edit the following lines:

1) search for

Code:

```
unsigned long int MMColorSet[]
```

add these under the last line of the array

Code:

```
0xFF00FFFF, //10
0xFF388E8E, //11
0xFF7D9EC0, //12
0xFFC67171, //13
0xFFF5F5DC, //14
0xFFA9A9A9, //15
0xFFEECF1, //16
0xFFEE7600, //17
0xFFCDC0B0, //18
0xFF000000, //19
0xFF8B2323, //20
0xFFCDAA7D, //21
0xFF458B00, //22
0xFFD2691E, //23
0xFF6495ED, //24
0xFFFFB90F, //25
0xFF8B008B, //26
0xFF2F4F4F, //27
0xFF7CFC00, //28
0xFFEEE685, //29
0xFF8470FF, //30
0xFFFFE4E1, //31
0xFFEE4000, //32
0xFF8E8E38, //33
0xFFFFA54F, //34
0xFFFF6347, //35
0xFF8B8B00, //36
0xFFF5F5F5, //37
0xFF00E5EE, //38
0xFF708090, //39
0xFFF4A460, //40
0xFF03FE4A, //41
0xFFFFE4E0, //42
0xFFEE4001, //43
0xFF8E8E3E, //44
```

2) now search for this

Code:

```
if(c=='^' && ('0'<=cc) && (cc<='9'))
```

change the 9 to Z, like this

Code:

```
if(c=='^' && ('0'<=cc) && (cc<='Z'))
```

3) again search for

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='9'))
```

and change the 9 to Z

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='Z'))
```

4) again search for

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='9'))
```

change the 9 obviously

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='Z'))
```

5) and the last one, search for

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='9'))
```

and again change the 9

Code:

```
if(c=='^' && ('0'<=szText[i+1]) && (szText[i+1]<='Z'))
```

- In total it would be 5 edits ! I hope I didn't miss any spot tho 😊

So a little explanation:

1) How can I choose my own colors?

the list above from //10 to //44 are custom colors, which means you can change them, go to this website <http://www.2createawebsite.com/build/hex-colors.html> and scroll down a little, choose your color, you'll see below it #[HEX], so change the color from the list above 0xFF[HEX] (FF at the first is the Alpha, don't change it)

2) Why there are 44 colors, even though characters from 0-9 & A-Z are less than this?

this is because codes in C++, use ASCII table characters, and in this table there are some characters between 0-9 and A-Z, google ASCII table and look at the pictures (how it looks)

3) Can I change the capital to small in the usage?

if you want you can, but you have to edit the source and make it in small, and you also have to make the range from a-z alone with 0-9, and not directly from 0-z

Finally I think everyone knows the usage tho XD

Code:

^[LETTER]

All the best for everyone 🍷👍👍
